Profile

Senior software engineer with 20+ years of experience building complex systems across startups and enterprise environments, including Immunet, Sourcefire, Cisco, Symantec, and TELUS.

Background in endpoint security, backend services, and distributed architectures, with current hands-on applied-AI product work. Known for simplifying complex systems, aligning teams, and turning ideas into working solutions.

Current Direction & Development Approach

Interested in applied AI, solutions engineering, technical leadership, and product-focused work that combines technology, people, and meaningful problems. I use AI-assisted development alongside engineering judgment in architecture, review, and validation.

Technical Foundation

Current AI work: Codex, Claude Code, TypeScript, Node.js, OpenAI API, vector search, Railway
Languages: C, C++, C#, Go, Python, Ruby, Perl, JavaScript, HTML, CSS
Cloud: AWS - Lambda, DynamoDB, S3, SQS, API Gateway
Systems & tools: Linux/Unix, Windows, distributed systems, CloudWatch, X-Ray, Docker, Git

Experience

Independent Applied AI Product Developer

Relationship education client | 2026-Present

- Designed, built, and deployed a private pilot that helps users explore a curated library of podcasts, articles, and book content through source-linked conversational answers.
- Used Codex and Claude Code as AI coding assistants throughout development, guiding architecture, reviewing generated code, and validating behavior through testing.
- Developed content-processing and retrieval workflows, and refined response safeguards to keep answers grounded in the library and within the product's intended scope.
- Built an evaluation workflow combining test scenarios, human review, and automated grading to examine citation quality, response behavior, and safety.
- Working with stakeholders to turn pilot feedback into product improvements and plan the path toward a production-ready release.

Technologies: Codex, Claude Code, TypeScript, Node.js, OpenAI API, vector search, Railway

Experience (Continued)

Cisco Systems (via Sourcefire / Immunet)

Senior Software Engineer | 2011-2023

Worked across endpoint security software and backend cloud systems for Cisco Secure Endpoint (AMP), through its evolution from startup to enterprise-scale platform.

- Developed endpoint agent components in C/C++ with a focus on performance, reliability, and security.
- Built telemetry, detection reporting, and event visibility systems; collaborated with security researchers on detection workflows and false-positive handling.
- Later contributed to backend services using Go and AWS, designing for scale, failure handling, and distributed-service reliability.
- Took on a key coordination role during a large cross-team project after senior team members departed, helping clarify direction and maintain progress under uncertainty.
- Frequently stepped into informal leadership roles to bridge gaps between teams.
- Used system diagrams and architectural thinking to build shared understanding; helped onboard engineers and explain complex system interactions.

Symantec Corporation

Software Engineer | 2008-2011

- Owned installer systems using C++, InstallShield, and MSBuild.
- Built and maintained deployment and upgrade flows, including edge-case handling and reliability.
- Contributed to client-side systems and local data storage using SQLite.

TELUS

Business Analyst / Developer | Early Career

- Automated repetitive operational workflows, dramatically increasing personal productivity.
- Contributed to the internal Quick Wins team delivering rapid automation solutions.
- Built tools that eliminated manual processes across teams, working with business users to understand their workflows.

Education

Bachelor of Science in Computer Science (Distinction)
University of Calgary
